output

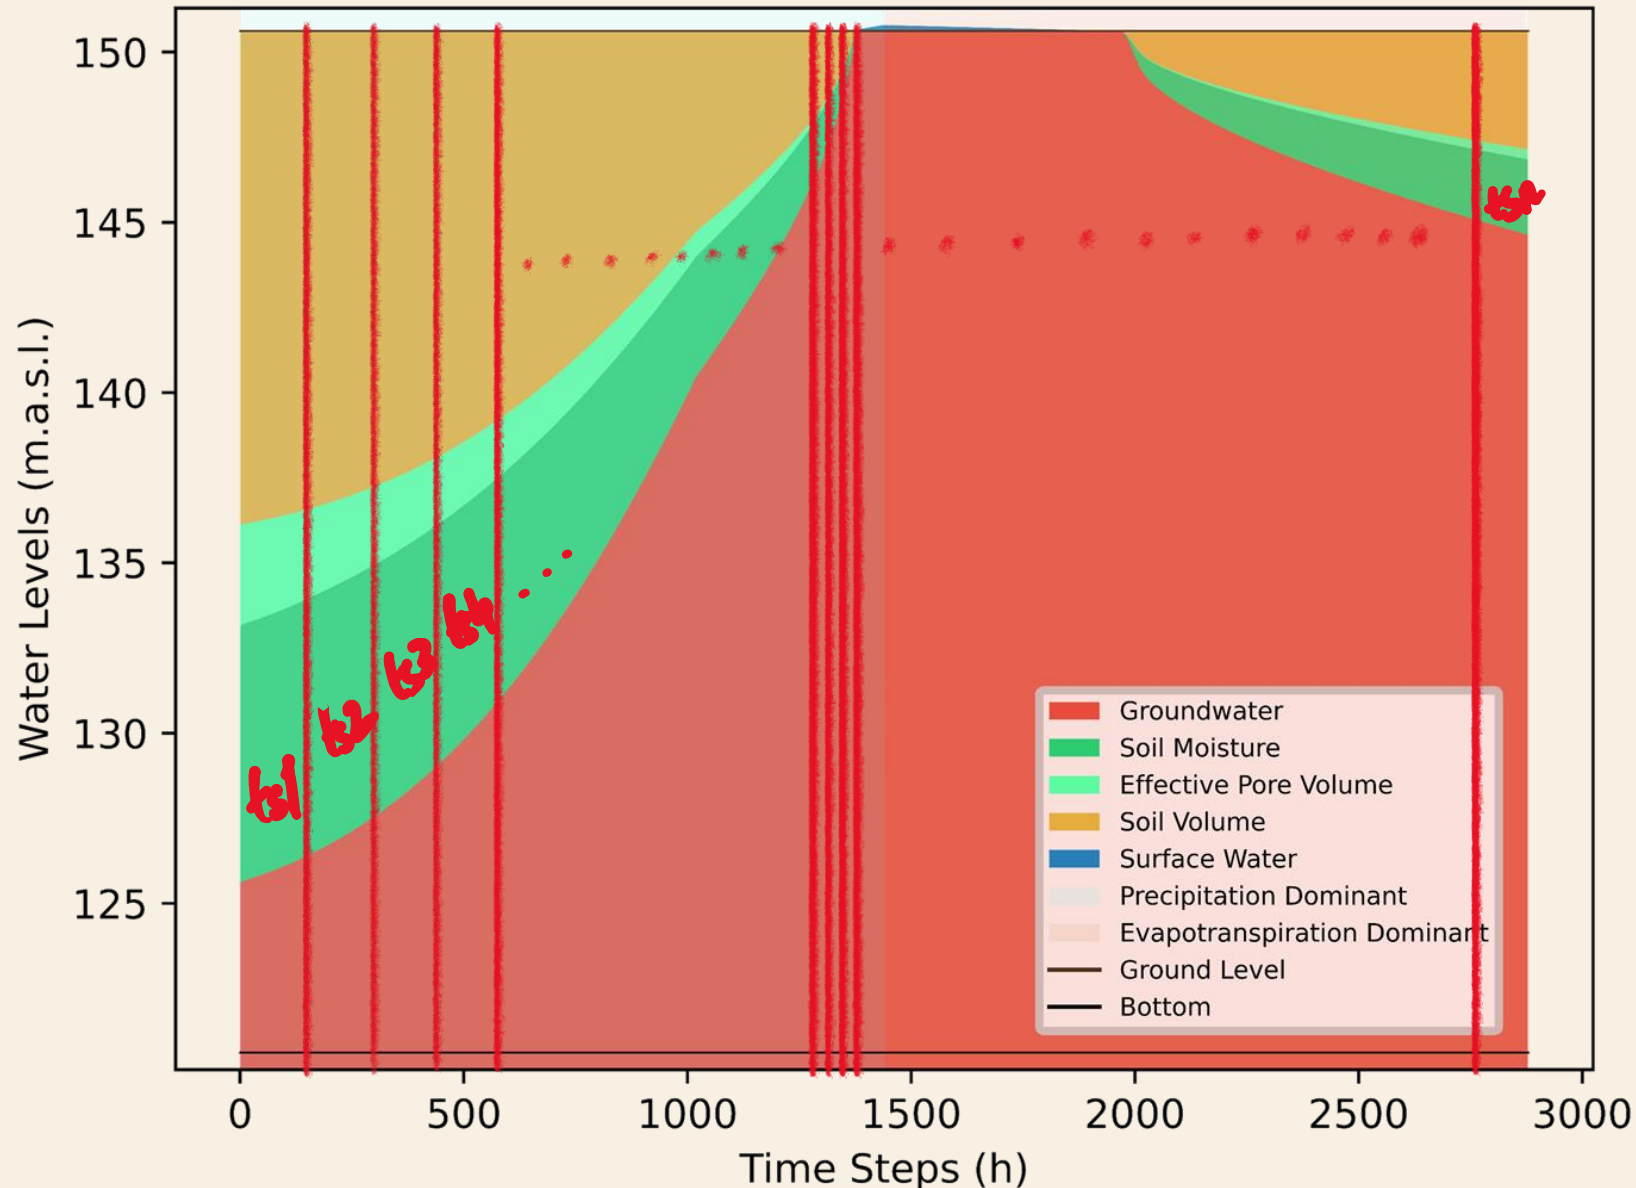

Illustration of the exchange processes per model element: GWSWEX

Model Physics: conceptualizing the Van Genuchten^[10] – Mualem Model^[11]

Model Behaviour: Sample model element

- Buildable as a standalone Fortran 90 program or as a python importable Fortran module (f2py)
- Average **execution time** for a model with *10,000 model elements*, and *3000 time-steps* is **~90 min** with no parallelization
- Parallelization can drastically reduce runtimes
